Public Comment for U.S. Livestock Protocol Version 4.0 Redline Version

Referring to the Redline Version of U.S. Livestock Project Protocol, I recommend a slight change on footnote 51 to clarify what standard conditions are of the volumetric flow. I recommend the following rewording for footnote 51 (on page 45 of Redline Version). This is in Redline Section 6.3: "51 Field checks and calibrations of flow meters shall assess the volumetric output of the flow meter in Standard Cubic Feet (SCF) at 1 atm pressure and 60°F temperature"
