Translated from Spanish by the Climate Action Reserve

Being that the priority of this Protocol is to encourage actions to reduce the drivers (such as CO₂) of climate forces in order to mitigate the repercussions of anthropogenic climate change, it is necessary to adapt requirements to clarify that the costs of monitoring, quantification, and verification, will allow for generating the value of the credits (CRTs).

Proposals to help achieve this are:

1. Increase the period of verification to 24 months.
2. Validate/certify quantification programs – software – that improve the efficiency of the operation.
3. Display a table or data-set that demonstrates or attests that the mechanism is profitable.

All of [these comments] is thinking of the industries that want to voluntarily reduce emissions while they are unregulated, since the Protocol is mainly directed towards PEMEX and CFE.

I understand that the last two proposals could not be drafted in the document, but could appear as informative annexes.
